

Box Build

It is increasingly becoming the norm to outsource the full manufacturing operation from a single order. Many companies have realised the benefits of being able to focus on product development and marketing without the worry of having to manage their production resources. It also saves the costs and logistics associated with split site operations.

CT Production is a complete electronics manufacturing service, allowing you to relax in the knowledge that we handle all aspects of the job for you, including:

- Procurement
- PCB assembly
- Conformal coating
- Potting / encapsulation
- Panel wiring and cable forming
- Electro-mechanical assembly
- Functional testing
- Safety testing

Functional testing and checking to your specifications mean that only proven fully working products leave our factory. When complete we can package and palletise your product ready for shipment to your distributor or end customer.

Whether your product is a small sub-assembly, a large cased unit or high volume product we will have the means to build it for you. Our assemblers and technicians are trained to IPC standards with many years of experience to draw upon, resulting in high quality products.

Current box-build contracts range from medium to high volume LED lighting, potted modules and security products through to large units for the nuclear industry, and defence and aerospace sectors.

We would be delighted to discuss how we can tailor our services to meet your requirements.
